Enjoy the Good Old Days

DpsDave.com

Our shipping address is a nearby UPS store. UPS is simply the best at logistic services, and we have partnered with the people in the Brown Trucks and the UPS Store so we can leverage their shipping and receiving expertise.

Your photos are processed in our production facility in the historic old city hall at 1215 Main in Philomath Oregon. Built in 1938, it housed the police and fire departments and city government at various times through the years. Local legend says that once desperados held the Chief of Police hostage for awhile here. The Wild West lives on!

Today, it's been restored, is called the Main Street Station, and is the home of DpsDave

Optical disks

An optical disk is commonly called either a CD, DVD, or Blue Ray disk. This creates some confusion, as people expect a CD to have music on it and to work in a CD player. The same is true for DVDs and Blue Ray disks, as people expect these to have movies on them, and play in a DVD or Blue Ray player on the television.

Actually, CD, DVD and Blue Ray refer to different types of construction and different data capacities of optical disks. Music has to be encoded as a music file and written on a CD disk to play in a CD player. Movies have to be encoded as a movie file and written on a DVD disk to play in a DVD player. There are a variety of music and movie file types as well, so it's no wonder everybody's confused.

What is on the disk we will send you.

We will send your images to you on a DVD-type disk, encoded as image files, not movie files. This type of disk is usually referred to as a "data disk." The image file type we use is called JPEG, which is universally accepted by all photo viewing and editing software packages. This type of data file is specifically designed for digital images, and the files are intended for viewing on computers, not televisions. However, some DVD players can read and display these image files on your television.

You can read and copy the images on the disk often, and you own the copyright to these images. However, the disk is protected to prevent accidental deletion. These disks are archive quality, and will last up to 75 years if you keep them in the jewel case and protect them from light and heat. Your great grandchildren will appreciate the effort you take now to preserve these disks!

Disk handling

The laser in your computer's optical disk drive works by finding and reading extremely small holes in the surface of the disk. Grime or fingerprints hide these holes from the laser, and make it hard for the computer to read the digital images from the disk. Please handle the disks by the edges, and avoid touching the shiny side of the disk.

The best 35mm Slide to Digital Conversion Service.

Your 35mm slides are 5,000 DPI, so we scan at 6,000 DPI to capture all the detail.

We have the lowest prices available online for converting 35mm slides to digital services.

All work done in the USA.

Print Quality Levels

Three quality levels are available for photos PRINTS sent to DpsDave for scanning:

ECONOMY: As our least expensive option, these images are scanned at 300 DPI. Our experience is that customers are generally disappointed with this slide and photo scanning quality option. Although it saves people money, you cannot zoom in on an image or print it. If you're interested, you can save even more by doing some of the work yourself by rotating images, fixing colors, scanning slides in order, and creating custom file structures.

HIGH DEFINITION: Our most popular slide and photo scanning quality option is to scan images at 600 DPI. Color Fix, Image Rotation, Scanning in Order and Custom File Structure are thrown in for free! This option allows you to zoom in, so you can recognize faces and make prints. Our experience is that customers are thrilled with this option.

PRESENTATION: The ultimate in scanning quality, preferred by our professional photographers, museums, restoration experts and graphic artists is the Presentation option. This slide and photo scanning quality option maximizes the quality of all digital images compared to other options.

See what John S. is saying about DPSDave photo scanning service:

“

I called Dave on Wednesday to get some photo scanning done ASAP and he was very accommodating considering that I need my order rushed for a wedding anniversary celebration. The photos were very old considering they were my parents' old photos from their wedding way back a long time ago. I packed it according to Dave's instructions and he has a very helpful site for packing directions which I appreciated a lot. His service is priced reasonably (the cheapest I actually found online) given the high quality of digital prints we got from really old photographs. He must have done some photo fade restoration, too. My parents were overjoyed when they saw the slideshow I created for them using the digital photos I got from Dave! The photos were really great even when viewed on a huge TV. I am really glad I found DPSDave because his excellent printed photo scanning can't be beat. They offer expedited service, too! Definitely recommending DPSDave for any picture and photo scanning service!”

Rating: 5/5

See what Robin K. is saying about DPSDave photo scanning service:

My mom loves dogs and she has this one favorite dog she had when she was just a kid. She's got an old printed photo with the dog that she's kept all these years which I know it meant a lot to her. I wanted to surprise her on her birthday so I searched online for a high quality photo scanning service. I found DPSDave and they had a photo of a dog on their website! I called them and spoke with Dave then found out it's his dog on the DpsDave.com website. He clearly loves his dog and I knew right then I found the perfect photo scanning service. I sent him the printed photo and had it scanned with the highest quality for printing. I believe it's called the Presentation Level. I got back a digital copy and had it printed and framed as a gift for my mom. She is ecstatic and I have Dave to thank for it. Made the excellent choice and got superb photo scanning service at a super reasonable price!

See what Jason L. is saying about DPSDave photo scanning service:

I stayed with my grandparents over the summer in Oregon and helped my grandmother clean the attic. We found old 35mm Kodachrome slides that were taken decades ago. I asked Granny if she wouldn't mind if borrowed the slides and see if I can get them digitized. I told her about a digital slide scanning service that was over at Corvallis. Shortly after I phoned DPSDave and asked if they could do some fade restoration. Dave said they've been doing photo scanning for years now and also explained about the unique Image Optimization software they use. There were about 2 dozen slides that I sent them and I honestly didn't expect them to finish the slide scanning service with photo restoration so soon. Just 2 weeks later, we got the digital prints and we played them on the TV and they looked awesome! You have to try it to believe it. Dave did an amazing job with the photo slide scanning and we are very impressed with their personalized service.

Rating: 5/5

See what Amy D. from California is saying about DPSDave photo scanning service:

My husband and I wanted to immortalize our old photos from our wedding 45 years ago through a digital picture scanning service. We heard about DPSDave from my sister who recently tried their service. I called Dave and asked if it was possible to also restore some old photos. He thoroughly explained some photo restrictions and then we sent him our stuff. When we got our digital photos on a DVD, I can definitely say for myself that DPSDave photo scanning service is top notch.
